

LAB 2: AGILE BACKLOG CREATION AND SPRINT SIMULATION IN JIRA

Scenario 50: Centralized Audit Trail Compliance Engine

Name: Bindu I

Srn: PES1UG24CS659

1.Epics and User Stories

EPIC 1: Audit Log Ingestion and PII Protection

Description: Handles the ingestion, parsing, PII protection, and integrity verification of enterprise audit logs.

User Stories

Story 1.1 – Receive Audit Logs

As a Compliance Officer,
I want to receive enterprise audit logs,
So that audit events can be processed by the system.

Story 1.2 – Parse JSON Audit Logs

As a Compliance Officer,
I want to parse structured JSON audit logs,
So that audit information can be processed correctly.

Story 1.3 – Detect and Mask PII

As a Compliance Officer,
I want to detect and mask sensitive PII fields,
So that sensitive information is not stored in cleartext.

Story 1.4 – Generate Integrity Hash

As a Security Auditor,
I want to generate an integrity hash for audit records,
So that the integrity of stored audit information can be verified.

EPIC 2: Audit Record Search and Filtering

Description:

Provides capabilities for searching, filtering, and viewing relevant audit records.

User Stories

Story 2.1 – Search Audit Records

As a Security Auditor,
I want to search audit records,
So that I can locate relevant audit events.

Story 2.2 – Filter Audit Records

As a Security Auditor,
I want to filter audit records using relevant criteria,
So that I can narrow down the required records.

Story 2.3 – View Matching Records

As a Security Auditor,
I want to view matching audit records,
So that I can examine the required audit information.

Story 2.4 – Handle No Matching Records

As a Security Auditor,
I want the system to indicate when no records match my search,
So that I know that no relevant audit records were found.

EPIC 3: Immutable Audit Export

Description:

Provides secure generation and storage of immutable audit exports.

User Stories

Story 3.1 – Select Audit Records

As a Compliance Officer,
I want to select audit records for export,
So that I can create an audit report containing the required records.

Story 3.2 – Generate Audit Export

As a Compliance Officer,
I want to generate an audit export,
So that audit information can be provided for compliance purposes.

Story 3.3 – Generate Export Hash

As a Security Auditor,

I want to generate a hash for the audit export,
So that the exported information can be verified.

Story 3.4 – Store Immutable Export

As a Compliance Officer,

I want to store the audit export immutably,
So that the exported evidence cannot be altered without detection.

EPIC 4: Export Integrity and Secure Access

Description:

Ensures exported audit information remains trustworthy and accessible only to authorized users.

User Stories

Story 4.1 – Verify Export Integrity

As a Security Auditor,

I want to verify the integrity of an audit export,
So that I can confirm that the exported data has not been modified.

Story 4.2 – Detect Modified Export

As a Security Auditor,

I want the system to detect a modified export,
So that tampering can be identified.

Story 4.3 – Restrict Unauthorized Access

As a Compliance Officer,

I want unauthorized users to be prevented from accessing audit exports,
So that sensitive compliance information remains secure.

Story 4.4 – Support Fast Audit Queries

As a Security Auditor,

I want audit queries to execute quickly,
So that I can efficiently investigate historical audit records.

2.BURNDOWN CHART

3.REFLECTION QUESTIONS

1. Did your estimations reflect the actual effort?

Answer:

The estimations reasonably reflected the effort for the simulated sprint. The six selected User Stories were estimated using Fibonacci Story Points based on their complexity and uncertainty. The sprint contained a total of 24 Story Points, and all 24 points were completed. Since this was a simulated sprint, the Story Points represent relative effort rather than exact hours.

2. Was your backlog well-prioritized?

Answer:

Yes, the backlog was prioritized based on user impact and importance. High-impact security and audit-related functionality such as PII protection, integrity hashing, and audit-log processing received higher priorities. Lower-impact supporting functionality was given lower priority. This allowed the most important functionality to be selected for Sprint 1.

3. How did your simulated sprint align with your plan?

Answer:

The simulated sprint aligned well with the plan. Six high-priority User Stories were selected from the backlog and included in Sprint 1. They were progressed through the Jira workflow and completed successfully. The planned 24 Story Points were completed, so the sprint achieved its planned workload.

4. What insights did the Burndown Chart give about your team's capacity?

Answer:

The Burndown Chart showed that the team was able to complete the planned 24 Story Points during the simulated sprint. The reduction in remaining work showed the progress of the sprint and indicated that the selected workload was achievable within the sprint. It also provided a visual way to compare completed work against the expected sprint progress.
